

Mobile Application Development

ASSIGNMENT 1

Problem Statement: Design a mobile application in Flutter for a Student Feedback App with the below requirements: -

1. Develop an application with a minimum of 3–5 screens (Activities).
2. Your app must include an attractive and interactive GUI with proper navigation using Intents.
3. Use appropriate UI components such as Buttons, TextView, ImageView, ListView/RecyclerView, Forms, etc.

Application Description:

VIPS Veritas is a Flutter-based mobile application designed to collect and manage student feedback in an organized and user-friendly manner. The application allows students to submit feedback regarding teachers, campus infrastructure, timetable, management, and general academic experience. The primary objective of the app is to improve communication between students and the institution while maintaining a clean, modern, and intuitive user interface.

The app includes authentication, feedback submission with ratings, feedback viewing and editing features, and a developer profile section. The user interface follows a modern design approach using gradient backgrounds, glassmorphism effects, and consistent typography.

The name *VIPS Veritas* combines the institutional identity of Vivekananda Institute of Professional Studies (VIPS) with the Latin word *Veritas*, meaning “truth” or “honesty.” The title reflects the core purpose of the application — to create a truthful and transparent platform where students can express genuine feedback about their academic environment. By integrating the institution’s name with the concept of truth, the app symbolizes authentic student voices contributing to continuous improvement in teaching quality, infrastructure, and overall learning experience. The name therefore represents a system built on openness, reflection, and constructive progress within the educational ecosystem.

Key Features: -

- User Login Screen (Dummy Authentication)
- Home Screen introducing the application

- Feedback Form with dynamic fields and star rating system
- View, Edit, and Delete previously submitted feedback
- Profile Screen with developer information
- Modern UI with animations and glassmorphism design

Application Flow: -

The application follows the workflow below:

1. Splash Screen → App logo appears.
2. Login Screen → User enters credentials.
3. Home Screen → Overview of the application.
4. Give Feedback → User submits feedback with rating.
5. View Feedback → User views, edits, or deletes feedback.
6. Profile Screen → Developer information and external links.

Flowchart: -

Application Screenshots: -

1. Splash Screen - Loads immediately on opening the app. Visible for 2 seconds and leads to login page.

2. Login Screen – Currently a dummy login screen that takes user = admin and password = admin123.

4. Give Feedback Screen – This is the main page of the app that user navigates to using the navbar and submits their feedback on various topics.

The image shows a mobile app screen titled "Give Feedback". The screen has a light green background. At the top, the title "Give Feedback" is centered in a bold, dark green font. Below the title, there is a form with four input fields, each with a dark green label and a dark green dropdown arrow on the right: "Student Name", "Batch", "Course", and "Feedback Topic". Below these fields is a large white text area with the label "Write your feedback" in dark green. At the bottom of the form is a dark green button with the text "Submit Feedback" in white. At the very bottom of the screen is a navigation bar with four icons and labels: a house icon for "Home", a pencil icon for "Give Feedb...", a list icon for "View Feedb...", and a person icon for "Profile". The navigation bar has a light green background. Below the navigation bar, there is a reflection of the screen.

5. View Feedback Screen - This screen allows user to view all the feedbacks that they have submitted on the app, about various topics.

6. Profile Screen – This is the screen where user can view their profile in the app. Currently displays the profile of the app creator.

Conclusion:

The VIPS Veritas application demonstrates the implementation of a multi-screen Flutter application with modern UI design, navigation using intents, form validation, and interactive components. The project highlights practical understanding of mobile application development concepts including UI/UX design, state handling, and user interaction.
